

Ex.no: 3 Cold Migration of VM from one host to another**Date:**

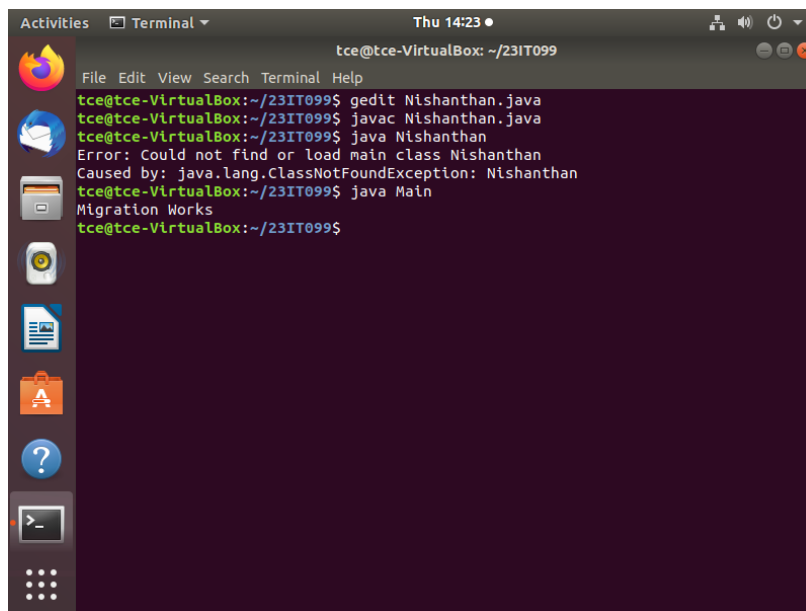

Aim:

To perform cold migration of a virtual machine (VM) from one host to another using the export/import appliance method (OVA format) in order to transfer VM configurations and disk data seamlessly while the VM is powered off.

STEPS:**Prerequisite**

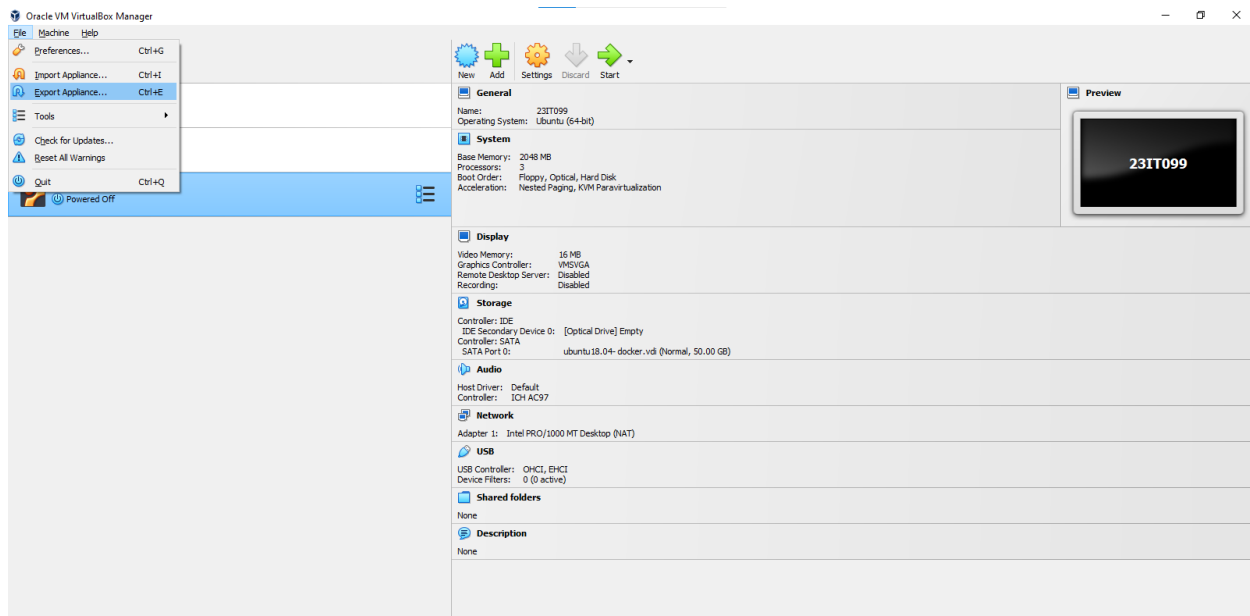

- VM must be shut down (powered off).
- Both systems (source and destination) must have VirtualBox
- Ensure enough storage on destination host.

1)Created a java file to check whether the same file exist in vm after imported(cold migrated) in another system

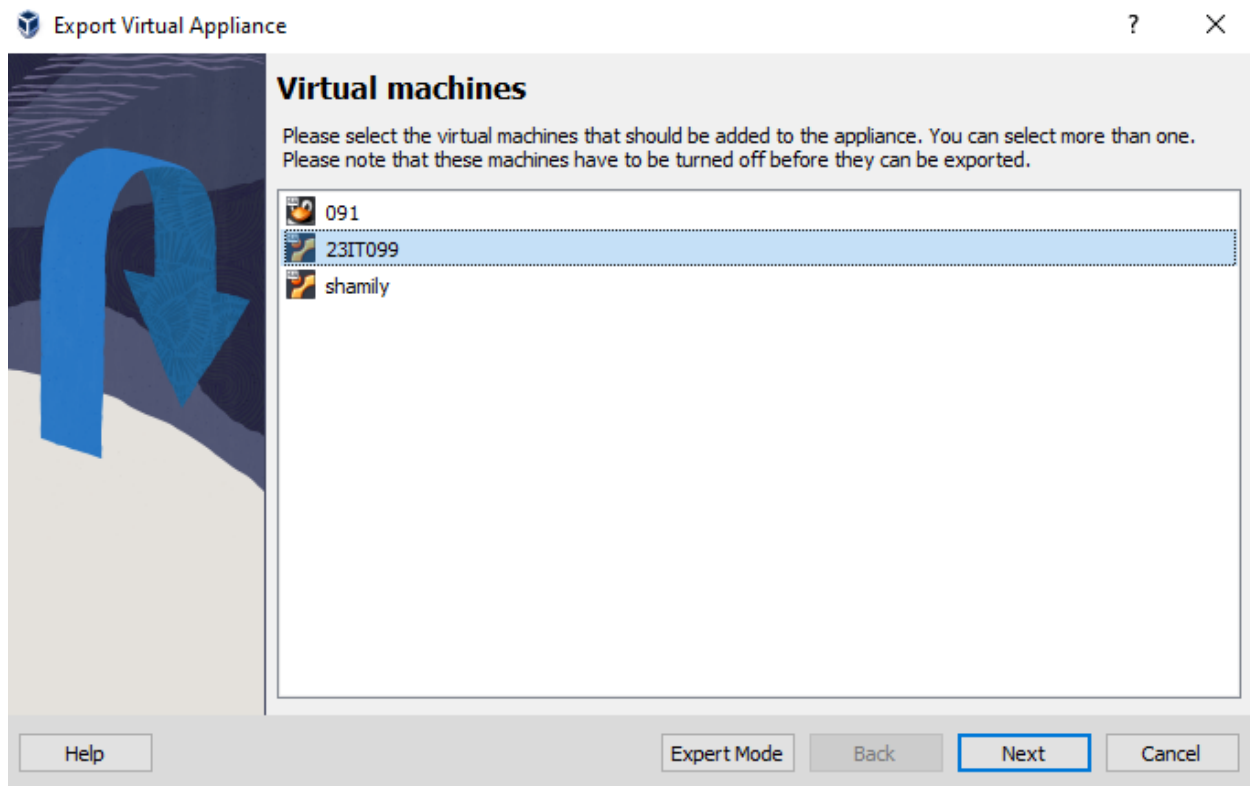

```
Activities  Terminal  Thu 14:23  tce@tce-VirtualBox: ~/23IT099
File Edit View Search Terminal Help
tce@tce-VirtualBox:~/23IT099$ gedit Nishanthan.java
tce@tce-VirtualBox:~/23IT099$ javac Nishanthan.java
tce@tce-VirtualBox:~/23IT099$ java Nishanthan
Error: Could not find or load main class Nishanthan
Caused by: java.lang.ClassNotFoundException: Nishanthan
tce@tce-VirtualBox:~/23IT099$ java Main
Migration Works
tce@tce-VirtualBox:~/23IT099$
```

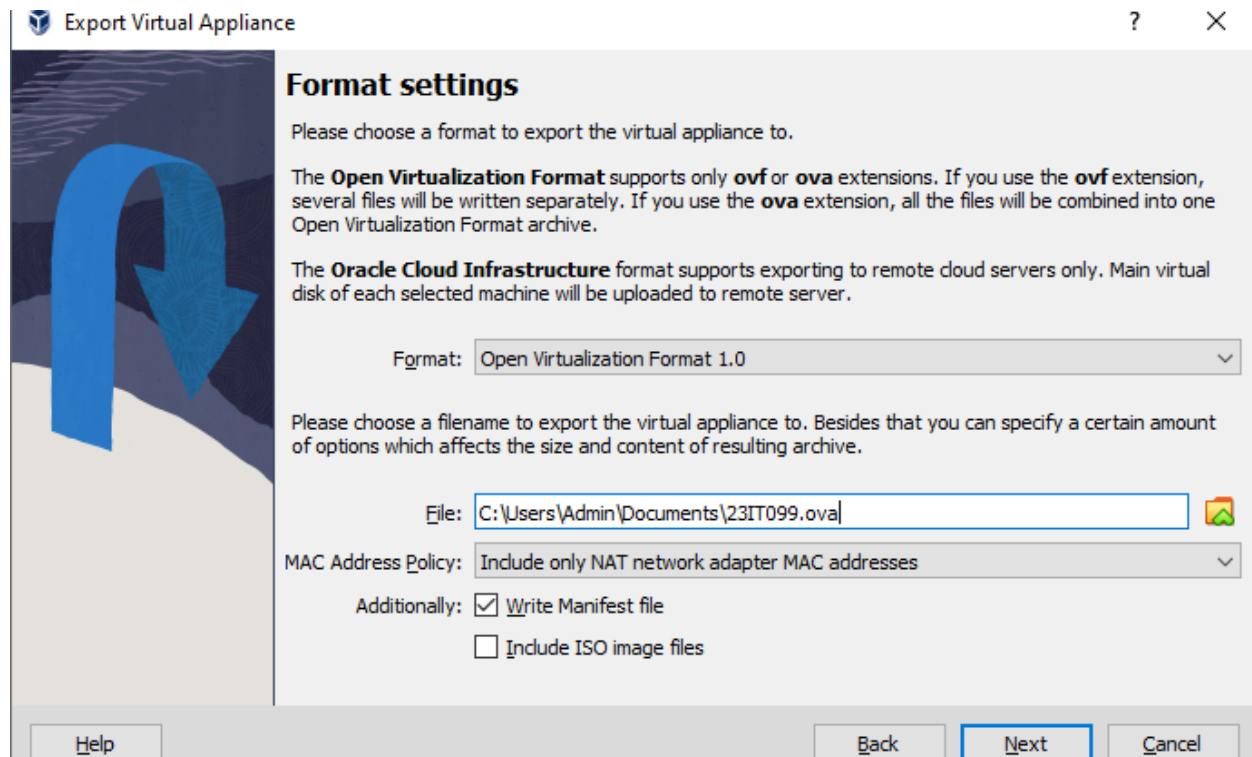

2) Shut down the VM completely. Open VirtualBox and select the VM → Click File > Export Appliance (or File > Export OVF).

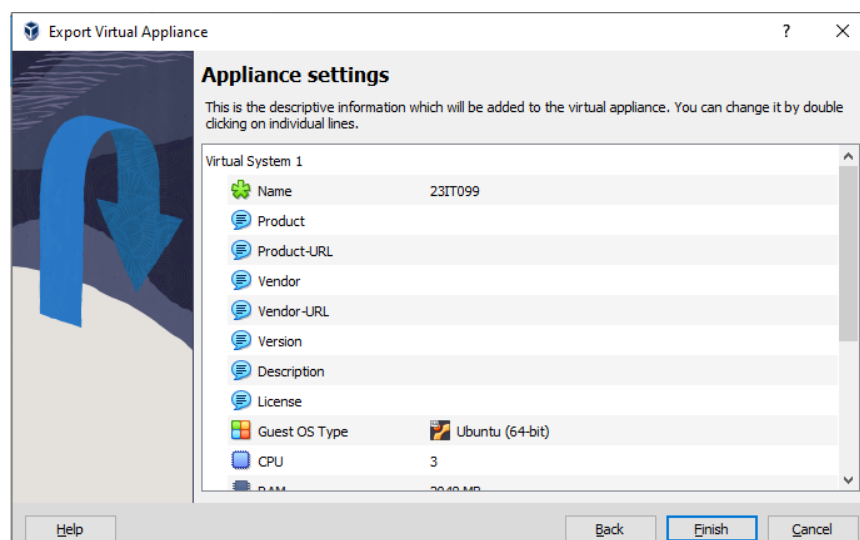

3) Select the vm which you want to export

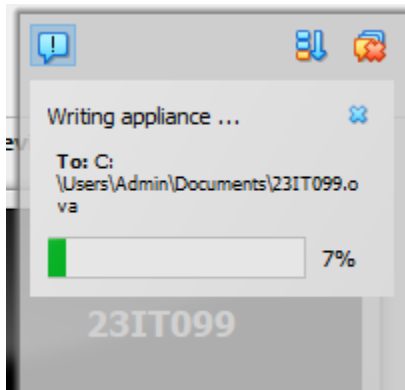

4) Select the format which you want to export ova or ovf file format and select the path where you want to export in the file system

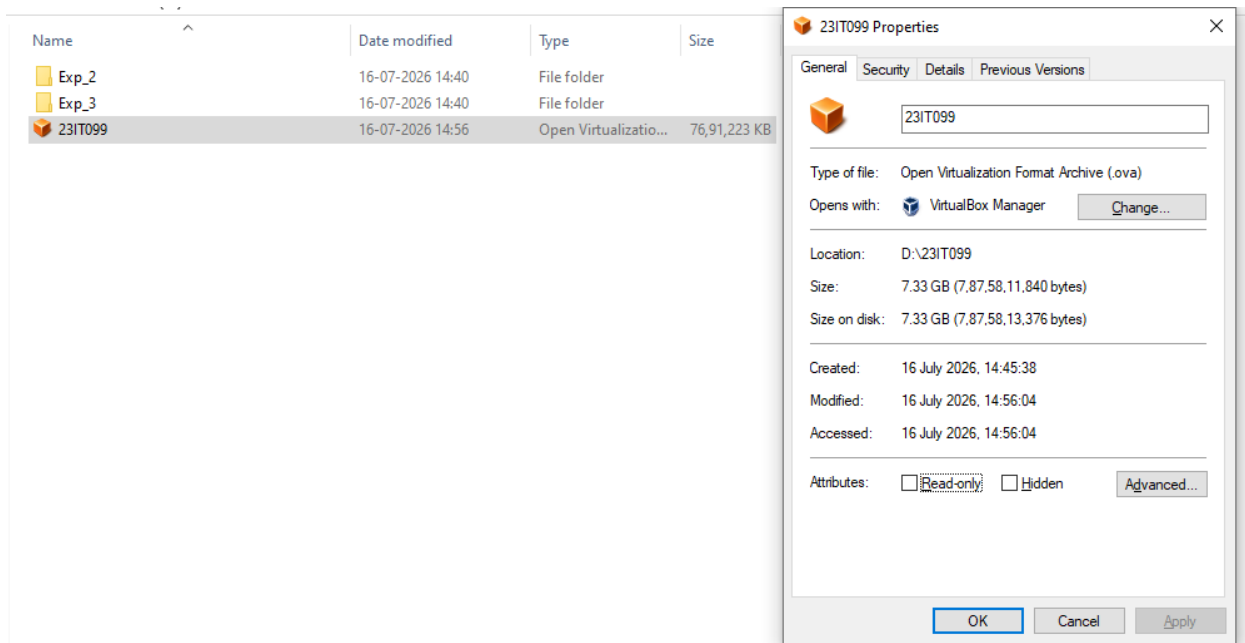

5) Click Finish to (export appliance to the file system where you selected the location)

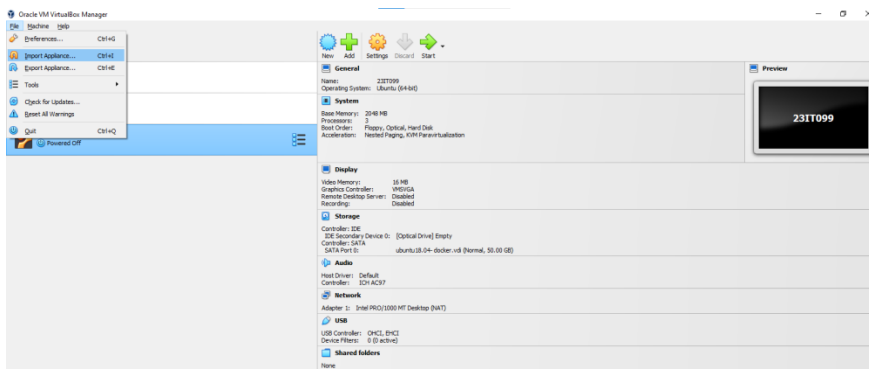

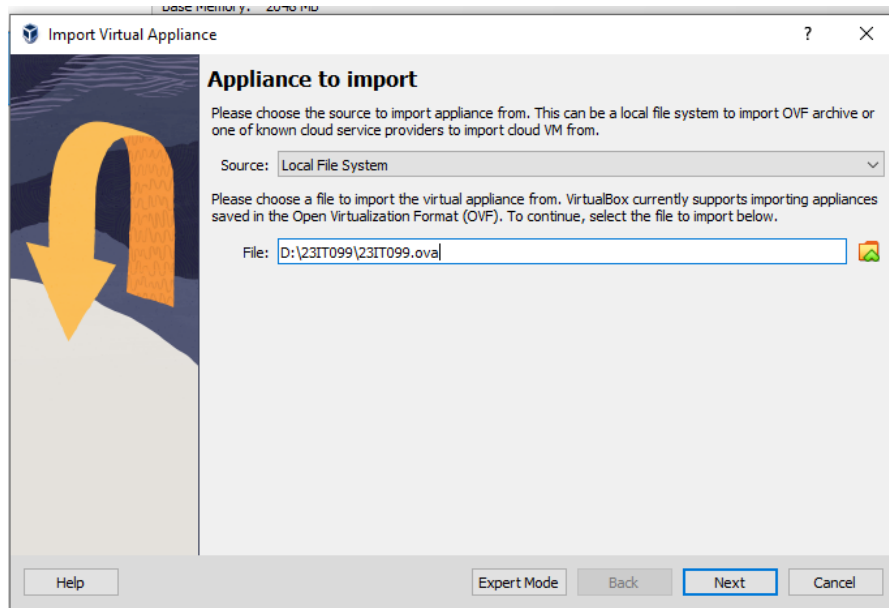

6) Check the folder whether the ova image has been present in the folder

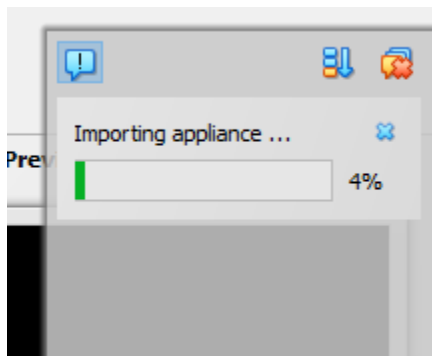

9) Import the image by import appliance in the file -> import appliance

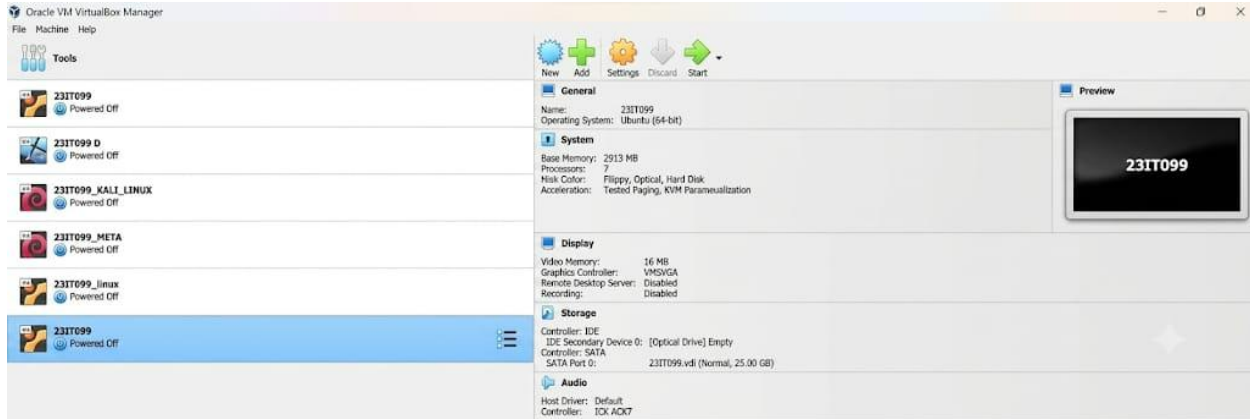

10) Import the ova file from the source

10) Now the image has been importing

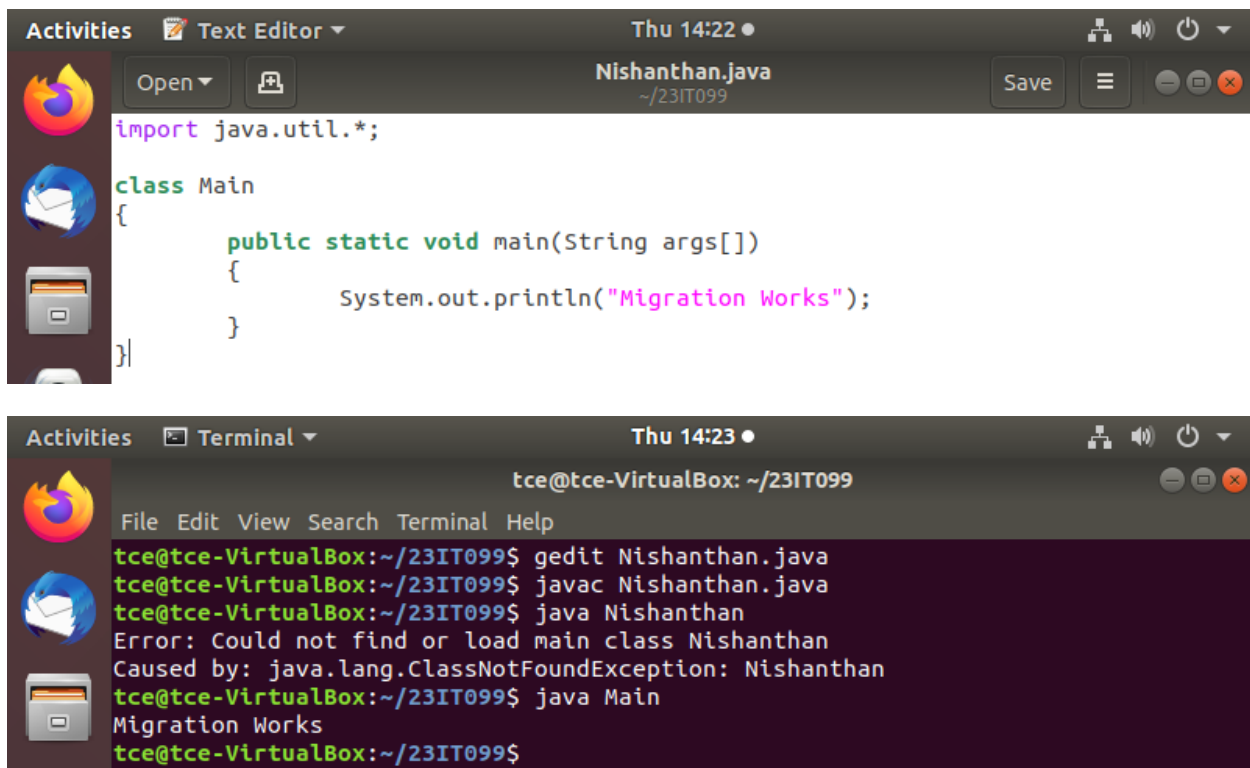

11) Check whether the vm is shown in the oracle virtual box and open it

12) Open the java file which you saved first using the linux commands gedit Nishanthan.java

And its verified that the file are located and cold migration has done

RESULT:

The virtual machine was successfully migrated to the destination host in a powered-off state(cold migration) using the OVA export/import method. All configurations and data were retained, and the VM booted up and functioned correctly on the new host.
